

VENTILATION UNITS STUDY - POSITION STATEMENT

Alan Macklin
Elta Group Technical Director

3/7/2015

UNIDIRECTIONAL VENTILATION UNITS (UVU) / FANS: (e.g. Box and Roof Fans)

Excerpts from the first stakeholder meeting Discussion Document

Excerpts from Regulation 327/2011

Article 2, Definitions

1. **'Fan'** means a rotary bladed machine that is used to maintain a continuous flow of gas, typically air, passing through it and whose work per unit mass does not exceed 25 kJ/kg, and which:

- is designed for use with or equipped with an electrical motor with an electric input power between 125 W and 500 kW (= 125 W and = 500 kW) to drive the impeller at its optimum energy efficiency point;
- is an axial fan, centrifugal fan, cross flow fan or mixed flow fan; and
- may or may not be equipped with a motor when placed on the market or put into service

12. **'Housing'** means a casing around the impeller which guides the gas stream towards, through and from the impeller;

Excerpts from Regulation 1253/2014

Article 2, Definitions

1. '**ventilation unit (VU)**' means an electricity driven appliance equipped with at least one impeller, one motor and a casing and intended to replace utilised air by outdoor air in a building or a part of a building;

Article 1, Subject matter and scope

2. This Regulation shall not apply to ventilation units which:

- c. are axial or centrifugal fans only equipped with a housing in terms of Regulation (EU) No 327/2011;

Annex I, Definitions

2. Definitions for NRVU, in addition to the definitions in Annex I Part 1:

3. '**reference configuration of a BVU**' means a product configured with a casing, at least two fans with variable speed or multi-speed drives, a HRS, a clean fine filter on the inlet-side and a clean medium filter on the exhaust-side;

4. '**reference configuration of an UVU**' means a product configured with a casing and at least one fan with variable speed or multi-speed drive, and -in case the product is intended to be equipped with a filter on the inlet-side -this filter shall be a clean fine filter;

Excerpts from the Working Document - Draft Ecodesign Regulation Review of Reg 327/2011

Definitions

1. **'Fan'** means a configuration of impeller, stator and drive system, intended for the continuous displacement of gas with at its bep an electric input power ≥ 125 W and ≤ 500 kW, a pressure-increase ratio lower than 1.1 and an output air velocity lower than 65 m/s, and which is an axial fan, centrifugal fan, cross flow fan, mixed flow fan or jet fan.

4. **'Stator'** is the stationary part of the fan which interacts with the air stream passing through the impeller and, within the geometrical air-stream envelope between defined fan inlet- and outlet sections, includes any part that may increase, and excludes any non-fan component that may decrease, the fan efficiency, following manufacturer's instruction.

Position Statement - Interpretation of Regulation 327/2011 'housing/stator' vs regulation 1253/2014 'casing'

Regulation 327/2011

The draft revision of Regulation 327/2011 has recognised the importance of definitions and moved away from the wording of 'housing' to the term 'stator'.

The critical factor which determines whether a product falls within the scope of Regulation 327 or Regulation 1253 lies in the definition of the function of the 'casing' included in 1253/2014 and the function of the 'housing' which will be changing to the 'stator' in Regulation 327/2011.

A 'housing/stator' is an essential component to fulfil the definition of a fan as per the Draft Regulation 327/2011. The 'housing/stator' increases the fan efficiency and the fan will not function correctly without a 'housing/stator'.

Examples:

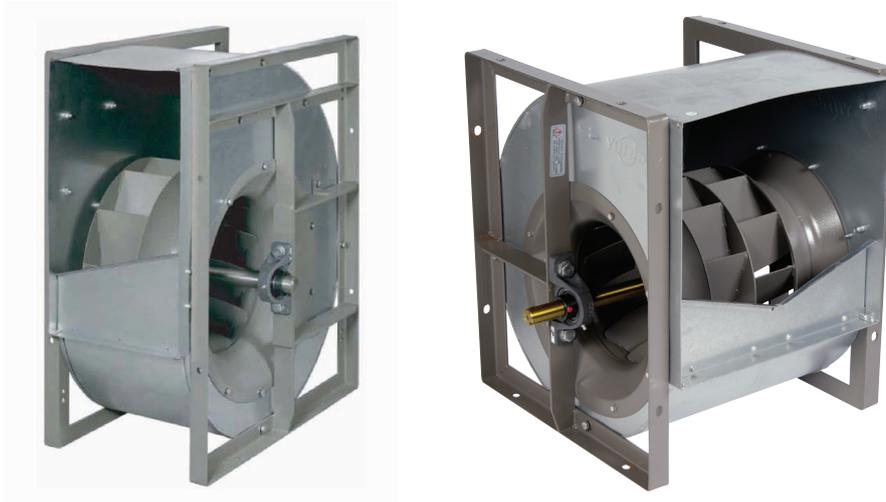

Fan casing (terminology per ISO 13349) required for an axial flow fan

Scroll plate and cut-off (terminology per ISO 13349) required for a forward curved fan

Scroll plate and shaped inlet (terminology per ISO 13349) required for a backward curved fan

Shaped inlet (terminology per ISO 13349) required for a centrifugal plug fan

Regulation 1253/2014

A unidirectional ventilation unit (UVU) comprises of a fan fitted inside a 'casing' to suit a specific market requirement. The fan fitted inside a UVU must comply with Regulation 327/2011.

The UVU encloses a fan within a 'casing' which decreases the fan efficiency in order for the UVU to fulfil its intended purpose and must comply with Regulation 1253/2014.

Examples:

Conclusion

The UVU 'casing' around the fan provides the required air flow direction, a means of fitment to ducts and exterior weather protection if mounted externally, all of which are detrimental to the fan efficiency due to additional turbulence and airflow restrictions.

The affects of the 'casing' for box fans and roof fans is impossible to calculate, hence the finished product must be tested to establish the performance and efficiency. Box fans and roof fans are performance tested in accordance with ISO 5801.

Appendix 1 provides relative FMEG data for a range of box fans and roof fans showing the effect that the 'casing' has on the measured efficiency of the fan fitted inside, reducing the FMEG value by up to 30%.

It can be clearly seen that classifying UVU box fans and roof fans under Regulation 327/2011 would wipe a large proportion of essential products from the market and is the reason for including UVU box fans and roof fans under Regulation 1253/2014 to allow for the negative effect on the fan efficiency due to the 'casing'.

APPENDIX 1

| FAN TYPE CATEGORY | | FMEG COEFFICIENTS | | | |
|-------------------|---------------------------|-------------------|-------|----------|-------|
| | | 0.125-10KW | | 10-500KW | |
| 1 | AXIAL FAN | 2.74 | -6.33 | 0.78 | -1.88 |
| 2 | CENTRIFUGAL F'WARD CURVED | 2.74 | -6.33 | 0.78 | -1.88 |
